

Software Requirements Specifications

Project Title: Micro-Service Hub

Part 2:Overall Description

Prepared by – Syeda Mohsina Tahsin

2.1 User Classes and Characteristics

There will be **three main types of users** in the Micro-Service Hub Platform.

1. Service Seeker

A Service Seeker is a person who needs help with a small task.

For example:

- Students
- Office workers
- Elderly people
- Families
- Small business owners

They can:

- Post a service.
- Set the budget.
- Set the location and time.
- Find a service provider.
- Choose a suitable provider.
- Chat with the provider.
- Make payment.
- Give ratings and reviews.

2. Service Provider

A Service Provider is a person who wants to earn money by doing small tasks for others.

For example:

- Students
- Freelancers

- Part-time workers
- Skilled people
- Local workers

They can:

- Find available services.
- Search for nearby services.
- Apply for a service.
- Chat with the service seeker.
- Complete the service.
- Receive payment.
- Get ratings and reviews.

3. Administrator

The Administrator manages the whole platform.

The administrator can:

- Manage users.
- Check user verification.
- Manage service posts.
- Check reports.
- Handle disputes.
- Monitor payments.
- Block or remove users when necessary.

2.2 User Needs

The platform will help both people who **need services** and people who **provide services**.

Service Seekers need:

- An easy way to find someone for small tasks.
- A way to post their service needs.
- Nearby service providers.
- Verified and trusted providers.
- A way to communicate with providers.
- A safe way to make payments.
- A way to give ratings and reviews.
- A way to report problems.

Service Providers need:

- An easy way to find small jobs.
- Nearby service opportunities.
- A way to search for suitable services.
- A way to apply for services.
- A way to communicate with customers.
- Safe payment after completing a service.
- Ratings and reviews to build trust.

The main goal is to make finding and providing small services **easy, safe, and convenient**.

2.3 Operating Environment

The Micro-Service Hub Platform will be a **web-based system**.

The system will use:

Frontend:

- React.js
- JavaScript
- Tailwind CSS

Backend:

- Node.js
- Express.js

Database:

- MongoDB

Other Tools and APIs:

- REST API
- Socket.IO for real-time chat
- Google Maps or OpenStreetMap for location
- Payment Gateway API
- KYC/NID Verification API

Users will be able to use the platform through common web browsers on:

- Desktop
- Laptop
- Tablet
- Mobile phone

An internet connection will be required to use the platform.

2.4 Constraints

The project may have some limitations:

- The project must be completed within the given academic time.
- Real NID verification may need an approved KYC service.
- Real payment systems may need a registered business account.
- Test or sandbox APIs may be used for payment and NID verification.
- Map APIs may have usage limits.
- Internet connection is required for some features.
- The first version will focus on the main features only.
- User information and payment information must be kept safe.

2.5 Assumptions

We assume that:

- Users will provide correct information.
- Service Seekers will provide correct service details.
- Service Providers will provide correct information about their skills.
- Users will have internet access.
- Users will use a supported web browser.
- Payment, map, and KYC APIs will be available when needed.
- Users will follow the rules of the platform.
- The Administrator will check reports and solve disputes.
- Test APIs may be used during the academic development of the project.
